## Chapter 11, Section 1: Water Resources **DAY ONE**

## **Water Resources**

•	Water is	to life on Earth. Humans can live for m	nore than month without
	food, but we can live for only a few days without	ut water.	
•	Two kinds of water found on Earth:		
	•,	, the water that people can drink, contain	ns little salt.
	•,	, the water in oceans, contains a higher o	concentration of dissolved
	salts.		
The V	Vater Cycle		
•	Water is a	because it is circulate	ed in the water cycle.
•	In the water cycle, water molecules travel between	een the Earth's	
	• Water		
•	Water vapor rises into the air.		
	As the vapor rises, it	to form clouds. Eve	entually the water in clouds
	falls back to the Earth.		
•	The oceans are important because	all of the Earth's v	vater is in the ocean.
Globa	al Water Distribution		
•	Although percent of the Ea	urth's surface is covered with water, near	rly percent
	of Earth's water is	in oceans and seas.	
•	Of the fresh water on Earth, about	percent is	in glaciers and polar
	icecaps.		
Globa	al Water Distribution		
•	The fresh water we use comes mainly from		and from a
	relatively narrow zone beneath the Earth's surfa	ace.	
Surfa	ce Water		
•		is all the bodies of fresh water, sal	t water, ice, and snow that
	are found above the ground.		
•	The distribution of surface water has played a v	rital role in the	of
	human societies.		
River	Systems		
•	As streams flow downhill, they combine with o	ther streams and form	·
•	A	is a flowing network of rivers and	d streams draining a river
	basin.		
•	The	system is the largest river system	em in the world as it drains
	an area of land that is nearly the size of Europe.		

Wate	ersheds
•	A is the area of land that is drained by a water system.
•	Rapidly melting snow as well as spring and summer rains can dramatically
	the amount of water in a watershed.
Grou	ındwater
•	Most of the fresh water that is available for human use be seen, as it exists
	underground.
•	is the water that is beneath the Earth's surface.
Grou	ındwater
•	As water travels beneath the Earth's surface, it eventually reaches a level where the rocks and soil are saturated
	with water.
	This level is known as the
•	The water table has that match the shape of the
	land above. Groundwater tends to flow slowly from the peaks to the valleys.
Aqui	fers
•	An is a body or rock or sediment that stores groundwater
	and allows the flow of groundwater.
•	They are an water source for many cities.
•	The water table forms the of an aquifer, and most aquifers
	consist of materials such as that have a
	lot of spaces where water can accumulate.
•	Groundwater can also rock formations, filling vast caves with
	water, creating underground lakes.
Poros	sity
•	is the percentage of the total volume of a rock or sediment that
	consists of open spaces.
•	The more porous a rock is, the more water it can hold.
Perm	neability
•	is the ability of a rock or sediment to let fluids pass through its
	open spaces or pores.
•	Materials such as that allow the flow of water are permeable. Materials such
	as clay or granite that stop the flow of water are impermeable.
•	The most productive aquifers usually form in permeable materials, such as
Tril 1	Dochones Zono
ı ne l	Recharge Zone  The tip on one in which water travels downward to
•	The is an area in which water travels downward to become part of an aquifer

	aquifer.	
The R	echarge Zone	
•	The size of an aquifer's recharge zone is affected by the	of the
	surface above the aquifer.	
•	Structures such as can act as	impermeable layers
	and reduce the amount of water entering an aquifer.	
Wells		
•	A hole that is to reach groundwater is called a well	
Wells		
•	The height of the water table changes seasonally, so wells are drilled to	below the
	water table.	
	Chapter 11, Section 2: Water Use and Management <b>DAY TWO</b>	
Watan		
water	Use and Management  A shortest of close fresh water is one of the world's	anvinanmantal
•	A shortage of clean, fresh water is one of the world's	environmentai
	problems.	
•	According to the World Health Organization, more than	people lack access to
GL L	a clean, reliable source of fresh water.	
	l Water Use	
•	There are three major uses for water:	
Global	l Water Use	_•
•	Most of the fresh water used worldwide is used to	
•	Industry accounts for about of the water used in the	
	highest percent occurring in	·
•	About of water is used by households.	
Reside	ential Water Use	
•	There are striking differences in residential water use throughout the world.	
	For example, the average person in the United States uses about	of water a
	day.	
	But in India, the average person uses onlyof water every of the state	lay.
•	In the U.S., only about half of residential water use is for activities inside the home, such as	
	The remainder of the water used residentially is used for activities outside the home such as	
Water	Treatment	Č

Recharge zones are environmentally sensitive areas because any pollution in the recharge zone can also enter the

Most water must first be made potable.

	means suitable for drinking.
•	Water treatment removes elements such as
	, which are poisonous to humans even in
	low concentrations.
Water	Treatment
•	A is a virus, microorganism, or other substance that causes disease.
•	Pathogens are found in water contaminated by, but
	can be removed with water treatment.
•	There are several methods of treating water to make it potable. A common method includes both
Indus	trial Water Use
•	Industry accounts for of water used in the world. Water is used to
	manufacture goods, to dispose of wastes, and to generate power.
Indus	trial Water Use
•	Most of the water that is used in industry is used to power plants.
•	Power-plant cooling systems usually from a surface water source
	such as a river or a lake, carry the water through pipes in a, and then
	the water back into the source.
Agric	ultural Water Use
•	Agriculture accounts for of the water used in the world. Plants require a lot of
	water to grow, and as much as 80 percent of the water used in agriculture evaporates.
Irriga	tion
•	is a method of providing plants with water from sources other than
	direct precipitation.
•	In the U.S.,sprinklers are the most common form of irrigation.
•	However, this method is because nearly half the water evaporates and never
	reaches the plant roots.
Water	Management Projects
•	Water management projects, such as, are designed to meet these needs.
•	Water management projects can have various goals, such as
	bringing in water to make a dry area
	creating a for drinking water,
	•, which then allows people to live and grow
	crops in desert areas.
Dams	and Reservoirs
•	A is a structure that is built across a river to control a river's flow.
•	A is an artificial body of water that usually forms behind a dam.

Hydroelectric dams use the power of flowing	ing water to turn a	that generates
electrical energy.		
About	of the world electrical energy is go	enerated using this method
Conservation		
	is one way that	we can help ensure that
everyone will have enough water at a reaso	onable price.	
Conservation in Agriculture		
Most of the water loss in agriculture come	es from	
Ç	, so	technologies that reduce
these problems go a long way toward cons		C

## Chapter 11, Section 3: Water Pollution **DAY THREE**

Wate	r Pollution	
•		is the introduction
		into water that is harmful to organisms
	living in the water or to those that drink or are exp	posed to the water.
•	However, the two underlying causes of water poll	lution are
Wate	r Pollution	<u> </u>
•	In developing parts of the world, water pollution i	is a big problem because often the only water available for
	drinking in these countries is polluted with	,
	which can spread waterborne diseases.	
•	Water pollution comes from two types of sources:	:
Point	-Source Pollution	<del>-</del>
•		is pollution that comes from a specific site.
Nonp	oint-Source Pollution	
•		is pollution that comes from many sources rather than
	from a single specific site.	
•	An example is pollution that reaches a body of wa	ater from
•	Controlling nonpoint-source pollution depends to	
		of the effects of activities such as spraying lawn chemicals.
Wast	ewater	
•	i	is water that contains wastes from homes or industry.
•	At a wastewater treatment plant, water is	to make the water
	clean enough to return to a river or lake.	
Treat	ing Wastewater	
•	Most of the wastewater from homes contains	that can be
	broken down by living organisms.	
Sewa	ge Sludge	
•	One of the products of wastewater treatment is	, the solid
	material that remains after treatment.	
•	Sludge can be an	to cities as the volume of sludge that has to be
	disposed of every year is enormous.	

Sewage Sludge

Artifi	cial Eutrophication	
•	Most nutrients in water come from, such as leaves and animal waste that	at is
	broken down into mineral nutrients by decomposers such as bacteria and fungi.	
•	Nutrients are an essential part of any aquatic ecosystem, but when lakes and slow-moving streams contain an	
	abundance of nutrients, they are	
Artifi	cial Eutrophication	
•	Eutrophication is a	
•	When organic matter builds up in a body of water, it will begin to	
Artifi	cial Eutrophication	
•	The natural process of eutrophication is accelerated when inorganic plant nutrients, such as	
	, enter the water from sewage and fertilizer ru	noff.
•	is a process that increases the amount of nutr	ients
	in a body of water through human activities, such as waste disposal and land drainage.	
•	The major causes of eutrophication are in so	ome
	laundry detergents.	
Artifi	cial Eutrophication	
•	is a plant nutrient that can cause the excessive growth of algae.	
•	In bodies of water polluted by phosphorus, algae can form large floating mats, called	
Cherr	nal Pollution	
•	is a temperature	
	in a body of water that is caused by	
	and that has harmful effect on water quality	and
	on the ability of that body of water to support life.	
•	Thermal pollution can occur when and other industries use water i	n
	their cooling systems and then discharge the warm water into a lake or river.	
Chern	nal Pollution	
•	Thermal pollution can cause if the discharged water is to	00
	warm for the fish to survive.	
•	As oxygen levels, aquatic organisms may	
Frou	ndwater Pollution	
•	Pollutants usually enter groundwater when polluted surface water down fr	rom
	the Earth's surface.	

•	products are common
	groundwater pollutants.
Grou	andwater Pollution
•	are another major source of groundwater pollution
	because as they age, they may develop leaks that allow pollutants to seep in to the groundwater.
Clea	ning Up Groundwater Pollution
•	Groundwater pollution is one of the
	problems in the world.
Ocea	nn Pollution
•	But at least percent of ocean pollution, including pollutants such as
	comes from activities on land, near
	the coasts.
Oil S	Spills
•	Ocean water is also polluted by accidental oil spills. Each year, about
	from tanker accidents are spilled into the ocean.
•	Such oil spills have dramatic effects, but they are responsible for only about
	in the oceans.
•	Water Pollution and Ecosystems
Wate	er Pollution and Ecosystems
•	Water pollution can cause immediate damage to an ecosystem, but the effects can be far reaching as some
	pollutants build up in the environment because they do not decompose quickly.
•	is the accumulation of pollutants at successive levels of the food
	chain.
•	Biomagnification has alarming consequences for organisms at the top of the food chain, and is one reason why
	U.S. states of fish people can eat from certain bodies of water.
Clea	ning Up Water Pollution
•	was to designed to "restore and maintain the
	chemical, physical, and biological integrity of the nation's waters."
•	The percentage of lakes that are fit for swimming has increased by, and many
	states have passed stricter water-quality standards.
Clea	ning Up Water Pollution
•	For example, the
	strengthened the laws against ocean dumping.
•	Also, the requires all oil
	tankers traveling in U.S. waters to have double hulls by 2015 as an added protection against oil spills
